Continuation of 11. does NOT place the application in condition for allowance because: On p12, the applicant argues that Tomohiko teaches that if transmission is performed between transfer apparatuses in different multicast domains, then multicast is not appropriate and unicast should be used. The applicant also states that Tomohiko does not suggest unicast as having retransmission capabilities. The examiner responds by arguing that what the applicant states with regards to multicast does not appear in the paragraph cited ([0030]). There is no statement asserting that multicast is not appropriate and that unicast should be used. Also, even if Tomohiko does not suggest unicast having retransmission, Sharony does teach this and, thus, render it obvious to have retransmission capabilities for unicast as detailed in the previous office action.

On p13, the applicant argues that Sharony does not teach retransmission for IP multicast and broadcast packets. The examiner respectfully disagrees and argues that even if it were true that Sharony does not teach retransmission for IP multicast / broadcast, the claims do not contain such limitation. The retransmission processing in the independent claims refer to the unicast protocol and there is no mention of IP anywhere in the independent claims. Sharony adequately meets the limitations of the independent claims and renders obvious the limitation that unicast have retransmission capabilities.

On p13, the applicant argues that Tomohiko does not correspond to the present invention because the application discloses retransmission at the MAC layer and not the IP layer. The examiner respectfully disagrees because the independent claims do not mention either the MAC or IP layers. The term "unicast" in the independent claims is adequately taught by Tomohiko which also teaches unicast being used between the multicast domains (fig.2, 40.).
